

Using Ly α to probe LyC escape from galaxies

Anne Verhamme

Assistant Professor, Geneva University
Associate Researcher, CRAL Lyon

SIMS: Valentin Mauerhofer, Jérémie Blaizot, Joki Rosdahl, Alaina Henry, Thibault Garel, Léo Michel-Dansac, Claudia Scarlata

LCEs: Daniel Schaerer, John Chisholm, Matthew Hayes, Ivana Orlitova, Yuri Izotov, Gabor Worseck, Natalia Guseva, Trin Thuan

MUSE: Mieke Paavast, Peter Weilbacher, Lutz Wisotzki, Josie Kerutt, Hanae Inami, Johan Richard and the GTO consortium

Outline

- * recent results on the escape of LyC from galaxies
- * using Ly α to trace LyC escape
- * Ly α properties of a virtual LyC emitter

What is Cosmic Reionization ? Why is it important ?

- * major phase transition in the history of the Universe
- * strong impact on galaxy formation and evolution
- * **main unknown :** the nature of the sources of Reionization

Can stars in galaxies reionize the Universe ?

- * produce a lot of ionising radiation, forming the Lyman continuum (LyC $\lambda < 912\text{\AA}$)
- * main unknown : LyC escape fraction
- * Numerous studies reporting non-detections :
 - * at $z < 1$ *Leitherer+95, Deharveng+97, Heckman+01, Deharveng+01, Malkan+03, Bergvall+06, Grimes+09, Bridge+10, Siana+10, Leitet+13, Bergvall+13, Rutkowski+16*
 - * at $2 < z < 4$ *Vanzella+10,12, Siana+15, Mostardi+15, Sandberg+15, Grazian+16, Vasei+16, Grazian+17, Rutkowski+17, Japeli+17, Marchi+17*
- * before 2016, only 3-4 detections :
 - * at $z < 0.3$: *Bergvall+06, Leitet+13, Borthakur+14*

Can stars in galaxies reionize the Universe ?

- * produce a lot of ionising radiation, forming the Lyman continuum (LyC $\lambda < 912\text{\AA}$)
- * main unknown : LyC escape fraction
- * Numerous studies reporting non-detections :

- * before 2016, only 3-4 detections :
 - * at $z < 0.3$: *Bergvall+06, Leitet+13, Borthakur+14*

Several detections reported over the last two years

- * 14 objects at $z < 0.4$ (*Izotov+16ab, Leitherer+16, Izotov+18ab*)
- * 4 objects at $z \sim 2 - 4$ (*deBarros+16, Vanzella+16, Shapley+16, Bian+17, Vanzella+18*),
+15 direct detections in *Steidel+18*

Observing the sources of cosmic Reionization in LyC?

$z \sim 5.7$
 $z \sim 5.9$
 $z \sim 6.1$
 $z \sim 7.1$

- * Intergalactic medium (IGM) opacity increases with redshift
- * direct detection of LyC impossible from galaxies at $z > 6$

Observing the sources of cosmic Reionization in LyC?

$z \sim 5.7$
 $z \sim 5.9$
 $z \sim 6.1$
 $z \sim 7.1$

- * Intergalactic medium (IGM) opacity increases with redshift
 - * direct detection of LyC impossible from galaxies at $z > 6$
- need for indirect diagnostics of LyC leakage from galaxies

Green Peas : 11/11 LyC emitters, fesc(Lyc) 2-73%

Izotov+16ab, Schaefer+16, Verhamme+17, Chisholm+17, Izotov+18ab

see Daniel's talk tomorrow, John's talk on Friday, Simon's poster

Green Peas : indirect probes vs LyC escape

Izotov+16ab, Schaefer+16, Verhamme+17, Chisholm+17, Izotov+18ab

- * no correlation between O_{32} and $f_{\text{esc}}(\text{LyC})$
- * strongest leakers have lower masses
- * tight correlation between Ly α peaks separation and $f_{\text{esc}}(\text{LyC})$, as expected !! *Verhamme+15, Dijkstra+16*

$\text{Ly}\alpha$ - LyC interconnexions

$\text{Ly}\alpha$ escape from galaxies : strong line

M. Dijkstra, Saas Fee Advanced School 2016

Partridge & Peebles 1967

~7-40% (!) of bolometric luminosity of young galaxies in Ly α emission line

$\text{Ly}\alpha$ escape from galaxies : resonant line

M. Dijkstra, Saas Fee Advanced School 2016

increasing orbital quantum number

$\text{Ly}\alpha$ escape from galaxies : to the highest redshifts

Ly α in **UV with HST**

Ly α in **optical from the ground**

Ly α in **IR with JWST**

The basics of Ly α RT : kinematics

- * Ly α is never tracing line of sight velocity, as an absorption line would do, but the bulk velocity of the scattering medium with respect to the Ly α source

The basics of Ly α RT : density

- * Ly α spectrum = distribution of the minimum necessary shifts for escape : always follows/traces the path of least opacity

Recovering systemic redshift from the Ly α line

Verhamme+18

half of the peaks separation

FWHM as proxy for peak shift

Theoretical Expectations

- spectral shape : narrow profiles, small $\Delta\nu$
- escape fraction : high, higher than LyC escape fraction
- spatial extent : steep slopes, most of the $\text{Ly}\alpha$ flux from the center

$\text{Ly}\alpha$ as indirect probe of LyC escape from galaxies

Theoretical Expectations

- spectral shape : narrow profiles, small Δ_V
- escape fraction : high, higher than LyC escape fraction
- spatial extent : steep slopes, most of the $\text{Ly}\alpha$ flux from the center

Observations, today

- 14 LyC emitters at $z < 0.4$

Bergvall+06, Leitet+13, Borthakur+14, Leitherer+16, Izotov+16a,b,18a,b

- 4 LyC emitters at $2 < z < 4$ *Vanzella+16, Shapley+16, Bian+17, Vanzella+18*
plus several new candidates from Steidel+18, Fletcher+18,
Naidu+18...
- see kanak and Emil's talks for very new detections

Ly α spectra

$\text{Ly}\alpha$ spectra of LyC Emitters : two possible geometries

Zackrisson+13

$\text{Ly}\alpha$ spectra of LyC Emitters – Triple peaks from holes

Verhamme+17

$\text{Ly}\alpha$ spectra of LyC Emitters : observations

$f_{\text{esc}}(\text{LyC}) = 46\%!$, *Izotov+18a*

$\text{Ly}\alpha$ spectra of LyC Emitters : observations

$\text{Ly}\alpha$ spectra of LyC Emitters : observations

Lessons from local LyC Emitters

- * [OIII]/[OII] ratios does not always correlate with $f_{\text{esc}}(\text{LyC})$
- * stronger LyC emitters are the least massive
- * $\text{Ly}\alpha$ peaks separation decreases with increasing $f_{\text{esc}}(\text{LyC})$

Verhamme+18 in prep

Conclusions

- * we have discovered a class of galaxies of the local Universe which are leaking ionising radiation
- * they share many properties of high-redshift galaxies (low mass, low metallicity, high SFR, young ages...)
- * among indirect indicators of LyC escape, Ly α is confirmed, O32 disregarded
- * on going : calibrate the indirect probes on simulations
- * future : understand why these galaxies are leaking, be ready for JWST
